

Ten Nobel Laureates Say the Bush Tax Cuts Are the Wrong Approach

Economists' Statement Opposing the Bush Tax Cuts

Economic growth, though positive, has not been sufficient to generate jobs and prevent unemployment from rising. In fact, there are now more than two million fewer private sector jobs than at the start of the current recession. Overcapacity, corporate scandals, and uncertainty have and will continue to weigh down the economy.

The tax cut plan proposed by President Bush is not the answer to these problems. Regardless of how one views the specifics of the Bush plan, there is wide agreement that its purpose is a permanent change in the tax structure and not the creation of jobs and growth in the near-term. The permanent dividend tax cut, in particular, is not credible as a short-term stimulus. As tax reform, the dividend tax cut is misdirected in that it targets individuals rather than corporations, is overly complex, and could be, but is not, part of a revenue-neutral tax reform effort.

Passing these tax cuts will worsen the long-term budget outlook, adding to the nation's projected chronic deficits. This fiscal deterioration will reduce the capacity of the government to finance Social Security and Medicare benefits as well as investments in schools, health, infrastructure, and basic research. Moreover, the proposed tax cuts will generate further inequalities in after-tax income.

To be effective, a stimulus plan should rely on immediate but temporary spending and tax measures to expand demand, and it should also rely on immediate but temporary incentives for investment. Such a stimulus plan would spur growth and jobs in the short term without exacerbating the long-term budget outlook.
